Computer Security Code of Ethics

Instructor: Bennet S. Yee

In learning to build secure computer systems, you will also learn about weaknesses that attackers may exploit to attack systems. While the goal is to learn how to protect systems and to build robust, secure systems, you will also be learning how many existing systems may be attacked. In order to receive a grade in this course, you acknowledge that you understand that you must be responsible with what you learn.

---

cut here

I will not use the knowledge learned from CSE 227 to break into computer systems uninvited. I will not share that knowledge with others unless they also agree to the Computer Security Code of Ethics.
